**Method of providing enhanced internet content to mobile device using accessory device, involves providing accessory device with internet networking interface, mobile device networking interface and embedded proxy web server**

Patent Assignee: KUMAR J (KUMA-I); RAMCHANDRAN K (RAMC-I); SRINIVASAN S (SRIN-I)

Inventor: KUMAR J; RAMCHANDRAN K; SRINIVASAN S

Patent Family ( 1 patents, 1 countries )

Patent Number	Kind	Date	Application Number	Kind	Date	Update	Type
US 20100293217	A1	20101118	US 2009454195	A	20090514	201079	B

### Abstract:

NOVELTY - The method involves providing accessory device (33) with an internet networking interface (36) which enables connection to internet (32) to **fetch internet content**, a **mobile device networking interface** (35) to enable connection to **mobile device** (31) and an **embedded proxy web server**. An internet content and accessory **data** combining module is provided to enable interfacing **data** from accessory device to proxy server. DESCRIPTION - An INDEPENDENT CLAIM is included for accessory **device of mobile device**..... USE - Method of providing enhanced internet content e.g. hypertext meta language content, extended meta language content to **mobile device** e.g. **personal digital assistant**, **mobile phone**, **smart phone**, **portable media player** using accessory **device** e.g. **cellular phone** line connection accessory device, global positioning system accessory device, radio broadcast receiver device, TV broadcast receiver **device with mobile device networking interface** e.g. **cellular packet data network interface**, **wireless fidelity network interface**, **satellite packet data network interface**, **WiMAX packet data interface**, other terrestrial packet **data interface**, physical electronic connection interface, Bluetooth wireless interface, wireless fidelity network **interface**, other local area network **interface** (all claimed) for interactive radio system. Can also be used to provide internet content to **mobile device** using accessory device such as global positioning system receiver, camera, and medical device..... ADVANTAGE - By providing accessory **device to mobile device** with internet networking interface, **mobile device networking interface** and **embedded proxy web server**, the interoperability with content from internet without loading native device drivers into the **mobile device**, enhanced applications programming using hypertext markup language deployed in internet and providing additional functionality that can interoperate with content of internet are achieved..... DESCRIPTION OF DRAWINGS - The drawing shows a schematic view of end to end system with **mobile device** using accessory device to access internet content..... 31 **Mobile device** ... 35 **Mobile device networking interface** ... An accessory device (33) to a **mobile device** (31) is described that enables enhanced internet content viewing experience, where internet content is enhanced using **data** from accessory device (41). This is achieved by combining an **embedded web proxy server** (37) into the accessory device (33) with enhancements that support merging **data** from the accessory device (41) into internet content. This enables accessory devices (33) to be used with both closed and open **mobile devices** (31).

### Claims:

We claim: 1. A method to provide enhanced internet content to a **mobile device** using an accessory device, comprising: a) providing said accessory device with an internet networking interface that enables connection to internet to **fetch said internet content**; b) providing said accessory device with a **mobile device networking interface** that enables connection to said **mobile device**; c) providing said accessory device with an **embedded proxy web server**; and d) providing said accessory device with an internet content and accessory **data** combining module that enables interfacing **data** from said accessory device to said **embedded proxy web server**. 			US 2002318237	A	20021213		

**Abstract:**

and quality of service, extends existing assets to improve time to market and reduce cost of development, has secure, reliable, and scalable applications, supports **web browser** clients and other new technologies and paradigms, and supports **application service provider (ASP)**, service-oriented business models... and time-sensitive goods such as newspapers, periodicals and promotional materials to consumers, both subscribers and non-subscribers, and to retail outlets. One exemplary arrangement includes a **web server**, a database server, and **handheld computers**. A database including at least route delivery information may be created and at least portions of the database may be communicated to respective handheld devices... .. intermittent or continual connectivity and/or data reporting, time stamping/time-based tracking, and retail manager signature input as part of data collection. Support for **ASP**, service-oriented business models may be provided.

**Electrocardiograph remote monitoring device for use by doctor, has electrocardiograph recorder connected with Internet through network interface to send electrocardiograph monitoring page to browser**

Patent Assignee: UNIV BEIJING IND (UYBJ); UNIV PEKING TECHNOLOGY (UYPK)

Inventor: BAI Y; LI J; LI Y; WU S; YANG C

Patent Family ( 2 patents, 1 countries )

Patent Number	Kind	Date	Application Number	Kind	Date	Update	Type
CN 101199417	A	20080618	CN 200710303940	A	20071221	200847	B
CN 100560020	C	20091118	CN 200710303940	A	20071221	201005	E

**Abstract:**

amplified and filtered electrocardiograph signal after voltage is upgraded, and displays a wave form on a display module (204). The electrocardiograph recorder is connected with **Internet** through a network **interface** (207) to **send** an electrocardiograph monitoring page to a **browser**.

...ADVANTAGE - The device has simple structure, and is **portable**. The **device** helps a doctor to access the **embedded web server** on the electrocardiograph recorder through the browser, thus allowing to diagnose at real time... operation system (101) and embedded Web server (102) that sustain TCP/IP agreement. HTML page is embedded with Applet program (104) for remote communication with CGI program (103) on embedded Web server. The doctor accesses the embedded Web server on electrocardiograph recorder through browser and then monitors and diagnoses at real... ..

**Claims:**

203) to be analyzed and processed after voltage is upgraded and displays wave form on display

module (204) and analyzes result. Recorder is connected with Internet through network interface (207) and sends electrocardiograph monitoring page to browser for displaying... which sustains TCP/IP agreement; step 2) that microprocessor (203) is implanted and installed with embedded Web server (102) so that embedded Web server supports CGI program; step 3) that HTML page is embedded with Applet program (104) which is put on embedded Web server (102) and the browser sustaining Applet... server terminal; step 4) that when Applet program (104) is monitoring at remote, browser sends requirement to embedded Web server (102) for requiring connecting with CGI program (103) at server terminal; step 5) that embedded Web servers runs CGI program (103) and establishes connection of Applet program (104) and CGI program (103). CGI program is divided into three parts: CGI1 (306) is in charge of reading basic information of patients stored on recorder and then displaying information on browser in the form of page; CGI2 (307) is in charge of reading out electrocardiograph signal from AD and performing QRS wave detection, heart rate calculation... of gear of five sorts of heart ratios and then sending electrocardiograph data and analyzing result to Applet program; CGI3 (308) is in charge of receiving basic information of patients set on browser and then storing basic information of patients in electrocardiograph recorder; step 6) that Applet program displayed on browser reads out data from CGI2 program through embedded Web server and displays electrocardiograph wave form and electrocardiograph signal analyzing result on browser...

#### Abstract:

**NOVELTY** - The device has an **embedded web server** adapted to displaying a **mobile telephone** starting page in a web browser, a server program driven by an embedded web server, a starting page of the telephone adapted to display information... **DESCRIPTION** - The device has an **embedded web server** adapted to displaying a starting page of the **mobile telephone** in a web browser when connected to the telephone via the web browser, a server program driven by an **embedded web server** to generate an instruction to enable communications between the **mobile telephone** and a telecommunications system using the **web browser** and to **transmit a message** to the **web browser**, which confirms that **data updated** in the **browser** have been updated in the telephone, a starting page of the telephone adapted to display information management menus and including a voice packet that stores... A device and method for managing information data in a mobile IP-based **mobile telephone**. The device and method employ an **embedded web server** for displaying a **homepage** of the **mobile telephone** on a **web browser** when linked to the mobile telephone through the web browser; and a program of server driven by the **embedded web server** to generate a command to enable communication between the **mobile telephone** and a telecommunications system using the **web browser** and to **transmit a message** confirming that **data updated** in the

web **browser** has been updated in the mobile telephone to the web **browser**. The **homepage** of the mobile telephone is **adapted to display information management menus** of the mobile telephone and includes a language pack that stores at least one language so that the information management menus can be displayed in... ..

#### Claims:

What is claimed is: 1. A device for managing information data in a mobile IP-based **mobile telephone**, the device comprising: an **embedded web server**, **adapted to display a homepage** of the **mobile telephone** on a web **browser** when linked to the mobile telephone through the web browser; a program of server driven by the **embedded web server** to generate a command to enable communication between the **mobile telephone** and a telecommunication system using the web **browser**, and to **transmit a message** confirming that **data updated** in the web **browser** has been updated in the mobile telephone to the web **browser**; a **homepage** of the mobile telephone, **adapted to display information management menus** of the mobile telephone and including a language pack storing at least one language so that the information management menus can be displayed in a...

**Mobile robot for industrial automation, travels into vicinity of short-range bi-directional digital radio link devices based on commands from remote web browser, for establishing digital radio link with SBDRL devices**

Patent Assignee: ZWEIG S E (ZWEI-I)

Inventor: ZWEIG S E

Patent Family ( 2 patents, 1 countries )

Patent Number	Kind	Date	Application Number	Kind	Date	Update	Type
US 20020173877	A1	20021121	US 2001261741	P	20010116	200324	B
			US 200247574	A	20020114		
US 6658325	B2	20031202	US 200247574	A	20020114	200379	E

#### Abstract:

NOVELTY - The mobile robot (20) receives commands over Internet from a remote web **browser** (6) through a CGI (7) of a robot's **onboard web server** (3). Based on the control of received commands, the **mobile robot** travels into the vicinity of short range bi-directional digital radio link (SBDRL) devices (13,14) and establishes a bidirectional, short range, digital radio link... ..6 Remote web **browser** ... ..7 CGI ... .. The invention is a computerized **mobile robot** with an **onboard internet web server**, and a **capability of establishing a first connection** to a remote web **browser** on the **internet** for robotic control purposes, and a **capability of establishing a second short range bi-directional digital radio connection** to one or more nearby computerized digital radio equipped devices external to the robot. The short... .. short-range digital radio devices capable of interfacing with the robot (such as sensors, mechanical actuators, appliances, and the like), a remote user on the **internet** may direct the robot to move within range of the external devices, discover their functionality, and **send and receive** commands and **data** to the external devices through the CGI **interface** on the robot's onboard web server.

#### Claims:

What is claimed is: 1. A **mobile robot** with an onboard web server, telecommunications means to link the onboard **web server** with the internet, and **onboard** telecommunications means to **establish additional short-range bi-directional digital radio links with a plurality of non internet connected external computer controlled devices**; wherein the **mobile robot**, under control by commands sent over the **internet**, travels into the vicinity of one or more of the external computer controlled devices and establishes a direct bi-directional, short-range, digital **radio link** with the external device. ## **Abstract:**

NOVELTY - The **mobile telephone** contains at least one **web server** in its micro-program control unit. The **web server(s)** can be coupled to at least one other **web server** and is coupled to at least one client. The further server is contained within the **mobile telephone**. DESCRIPTION - INDEPENDENT CLAIMS are also included for use of the **mobile telephone** for guiding a vehicle and a medical supervision of patient. . . . ADVANTAGE - Developed to enable simple communications using the internet. . . . The **WEB server** and **WEB browser** are standard **applications** which merely have to be tailored somewhat for the concrete **applications**. All the other **servers** may be realized as C/C++ programmes which can access the hardware (for example glucose measuring device or the GPS receiver). They are connected to the **WEB server** via a CGI (common gateway interface) . . . Mobile telephone for internet application The **mobile telephone** contains at least one **web server** in its micro-program control unit. The **web server(s)** can be coupled to at least one other **web server** and is coupled to at least one client. The further server is contained within the **mobile telephone**. Independent claims are also included for use of the **mobile telephone** for guiding a vehicle and a medical supervision of patient. . . . An implementation|achievement of the **mobile telephone apparatus** containing at least one **Web server**. The **mobile telephone apparatus** of this invention contains at least one **Web server**. This **Web server** can be combined now with at least one the further server and the further at least 1 client. FIG. 1 Especially this invention relates to the **mobile telephone apparatus** which can be used for the communication system for monitoring a vehicle,

guiding or monitoring a patient's state of health... ... A **mobile telephone** according to the invention contains at least one **WEB server** which can be coupled to at least one further server and to at least one client... ... A control unit for a **mobile telephone** includes a **Web server** adapted to connect to a **Web browser** in the **mobile telephone**, wherein the **Web server** receives information and provides the information to the **Web browser** when connected to the **Web browser**. ... ..

#### Claims:

**Mobile telephone** having a **WEB browser** characterized in that at least one **WEB server**, which receives and evaluates enquiries from the outside, is contained in the microprogram control unit (MCU) of the **mobile telephone**..... At least one **Web server** is included, The **mobile telephone apparatus** characterized by the above-mentioned, At least one **Web server**, The **web browser** of one at least connected to the said **Web server**, These are provided, The said **Web server** receives information, and it is comprised so that the said information may be provided to at least the above-mentioned **web browser**, The **mobile telephone apparatus** characterized by the above-mentioned... .. 1. **Mobile telephone**, characterized in that it contains at least one **WEB server**. 2. **Mobile telephone** according to claim 1, characterized in that the at least one **WEB server** is contained in the microprogram control unit (MCU) of the **mobile telephone**..... What is claimed is: 1. A control unit for a **mobile telephone** comprising a **Web server** adapted to connect to a **Web browser** in the **mobile telephone**, wherein the **Web server** receives information and provides the information to the **Web browser** when connected to the **Web browser**. ... ..

**Exchange management system using cellular phone web connection function**

Patent Assignee: LG ELECTRONICS INC (GLDS)

Inventor: JUN S J

Patent Family ( 1 patents, 1 countries )						
Patent Number	Kind	Date	Application Number	Kind	Date	Update Type
KR 2002026060	A	20020406	KR 200057660	A	20000930	200267 B

#### Abstract:

NOVELTY - An exchange management system using a **cellular phone** web connection function is provided to connect a **cellular phone** to the web by installing a gateway between the **cellular phone** and a **web server**, and to manage an exchange through the **cellular phone**, so as to manage the exchange by using the **cellular phone** at any places without a terminal. DESCRIPTION - A gateway(57) transmits WAP(Wireless Access Protocol) data transmitted through a **cellular phone** terminal as data communicable on the **Internet**, or converts protocol data of an exchange into WAP data. A **web server**(56) receives the communicable data, and transmits information on the exchange to the gateway(57). An HDML CGI(Common Gateway Interface) processor(55) reassembles message data of the exchange to make the data HDML data, and transmits the HDML data to the **web server**(56). A communication module(53) transmits data transmitted from a user to the exchange by TCP/IP, and transmits the message data to the CGI processor(55). An exchange built-in communication module(52) receives requested data of the user from the communication module(53), and transmits the message data... Basic Derwent Week: 200267

			WO 2001US2414	A	20010125	

#### Abstract:

NOVELTY - A client device (20) includes a resident web browser (100) and a resident **web server** (200). The resident browser include the ability to call HTML or **ASP** pages, either from the resident **web server** or from a network **web server**. Also, the resident browser can call an application (205), such as an **active server page**, from the resident **web server** to enable the user to conduct a transaction with the application running in the resident server. ... a network; A method for executing a transaction on a remote communications device; A method for communicating data from a remote communication device to a **web server**; A method for persistent storage of application data for an application running on a remote communication device; A method for deploying a file to a **handheld communication device**; A method for controlling access to a **web server** on a remote communication device; A method for generating an application for use on a **handheld communication device** with a microprocessor.... USE - For conducting on-line and off-line transactions on a wide variety of remote communication devices, including **handheld computers**, **personal digital assistants**, palm tops, wireless devices, etc.... ADVANTAGE - The device enables real-time applications to run on a remote communication device and to **receive** and **store data** through a resident **web server** and resident **browser** on the remote communication device. By enabling local communications between the resident server and resident browser, off-line communications and real-time applications can occur... When a network connection is established, a transaction and associated data can be transmitted to the desired location on the network, such as an enterprise **web server** for further processing. Because the remote device can utilize a resident browser to communicate with the resident **web server**, low-memory applications such as active server applications or Java server page applications

can be maintained locally on the remote device, thus allowing more immediate... The present invention provides both a system and method for conducting remote online and offline real-time transactions on a **handheld device**. The remote communication device utilizes a resident browser and hypertext transfer protocol (HTTP) to communicate with a resident **web server**. Low memory applications such as **active server page** applications can be maintained locally on the remote communication device... Basic Derwent Week: 200257...

**Remote monitoring and control method involves connecting several monitoring and control apparatus to monitor and control equipment provided with web server function and connected to internet**

Patent Assignee: CHUO DENSHI KK (CHUO-N)

Inventor: KAYANUMA S; UKITA H

Patent Family ( 1 patents, 1 countries )							
Patent Number	Kind	Date	Application Number	Kind	Date	Update	Type
JP 2001345944	A	20011214	JP 2000163056	A	20000531	200214	B

#### Abstract:

NOVELTY - Several monitoring and control apparatus are connected to a monitor and control equipment (1,2) provided with **web server** function. The monitor and control equipment is connected with ethernet (22,23) and router (3,27) to the internet (5). The data collected with the monitor and control equipment are sent as a telegraphic message generated in HTML format for **mobile telephone** terminals. DESCRIPTION - The condition and sensor information on a monitoring control apparatus is displayed to the indicator of the **mobile telephone** terminal. Control information will be received by CGI function of **web server** if the monitoring control apparatus displayed by the indicator is operated from the **mobile telephone** terminal. A monitoring control apparatus is controlled and a power supply is turned ON and OFF... ..USE - Remote monitoring and control method by **mobile-telephone** terminal... ..ADVANTAGE - Allows apparatus to be monitored and controlled from arbitrary points since **information transmission** and control of apparatus can be performed using the internet by simple operation of **mobile telephone** terminal... #### Abstract:

DESCRIPTION - A user connecting unit(100) includes an **internet** connecting unit(110) capable of **transmitting/receiving of a message** by connecting to a messaging **web server**(300) through an **internet** network(210). The internet connecting unit(110) comprises a desktop personal computer(111), a LAN(112) and a modem(113). The user connecting unit(100) includes a **mobile** connecting unit(120) capable of transmitting/receiving of a message by connecting to the messaging **web server**(300) through a wireless data network(220) out of a data communication network(200). The **mobile** connecting unit(120) comprises a mobile communication tool as a **mobile phone**(121), a PDA(122) and a notebook PC etc. and a wireless modem(125) being included in the notebook PC and being connected to the wireless data network(220). The data communication network(200) includes an internet network(210) performing a connection the internet connecting unit(110) to the messaging **web server** (300). The data communication network(200) includes the wireless data network(220) rendering the **mobile** connecting unit(120) to be connected to the messaging **web server**(300) and transmit/receive a message. The wireless data network(220) comprises a base station(221) transmitting/receiving to the **mobile** connecting unit(120) and a mobile internet server(222) connecting the base station(221) to the messaging **web server**(300). The messaging **web server**(300) comprises a **web server**(310) rendering the user connecting unit(100) to be connected to a messaging server(320), the messaging server(320), a CGI(330) performing a demand in the user connecting unit(100) and returning the result to the user connecting unit(100), a database(340) storing a... ..

**Abstract:**

a cyberstore, or an electronic distribution chain may desire to provide the customized player in various apparatuses, such as PCS, a set-top box, a **hand-held apparatus**, others. It is a tamper-proof (change-proof) environment, i.e., the environment which suppresses access by the third party to the content in process...top box (IRD), and an Internet device is contained in an end user apparatus. These apparatuses can copy content to an external medium or a **portable consumer apparatus** according to permission by a content owner. "Content" only points out the information and data which were stored by the vocabulary "digital content" or the...number of the copies (or deletion of a copy) made is managed. When a permission is granted, The copy to an external medium or a **portable consumer apparatus** is performed. In order that a **portable consumer apparatus** may process the service condition of the content embedded at the watermark, the subset of the function of the player application 195 can be performed...to the store service condition 519. On the store service condition 519, it can be designated whether the content 113 is recordable on an external **portable apparatus** as the playback frequency|count permitted about the content 113, and the number of local copies. Many functions of the content use control layer 505... purchaser side also needs to process the received content 113 and needs to achieve a reproduction|regeneration or the format suitable for transmission to a **portable apparatus**. B. Division and flow of function The rights management architecture model is shown by FIG. 8, This is a figure which shows a mapping of the...content 113 is permitted is permitted, and whether the frequency|count of a secondary copy and the content 113 can be copied to an external **portable apparatus**. The content provider 101 sets the permissible service condition 517, and transmits this to the electronic digital content store 103 within SC. (Please refer the...purchased by the selection end user of content use. There exists an item every offer SC641.- The 1 or more HTML page which the player **application 195 displays in an internet browser** window during the interaction|dialogue between the time of reception of HTML transaction SC640 to display or the end user apparatus 109, and the clearing...a website. The content provider 101 has design of this site, and the perfect control with respect to a layout, Moreover, use of the turnkey **Web server** solution provided as some toolkits for secure digital content electronic distribution system 100 can be selected. In order to implement design of itself for this... ..on that day (or period) can be performed

every day (every defined period). This notification is performed via the standard HTTP replacement|exchange with the **Web server** of the electronic digital content store 103 by transmitting the **CGI** character string of definition completed containing the parameter which refers metadata SC620 added. This message is processed by the notification interface module of the electronic...base provided via telephone modem connection or cable modem connection. Networks other than the internet are also supported with this model, as long as a **Web server** / client browser model is followed. FIG. 12 is the main tools of the electronic digital content store 103, a component, and a block diagram that...offer database 181. The transaction processor module 175 and other additional functions are only provided as API in DLL or C object library as the **Web server** side executable thing (Namely, **CGI** and **NSAPI**, breadth in ken that can be **ISAPI** called). These functions process a processing at the time of the execution for an end user interaction|dialogue and an interaction|dialogue with the clearing house 105 of option. These functions interact a dialog with the commercial transaction service of a **Web server**, produce a file required in order to start the download processing of the content 113, and download it to the end user apparatus 109. These...content 113 is a music. The title of the sales promotion information regarding music or an album and an album and an artist are also **displayed**. This **information** is **displayed** as a series of linked HTML pages in a **browser** window. No metadata of the others which the content provider 101 wishes protection the content 113 of music, a lyric, etc. which can be purchased...of the purchased content 113. This information is packaged by transaction SC640. This transaction SC640 is returned to the end user apparatus 109 by the **Web server** as a response with respect to purchasing submission|transmission. The transaction processor module 175, The HTML page or **CGI** URL which confirms three information from the commercial transaction handling processing of the electronic digital content store 103, i.e., product ID of the purchased... and reproduction|regeneration control by the end user apparatus 109. The last parameter that the transaction processor module 175 requires is the HTML page or **CGI** URL which confirms purchasing liquidation. The objective of this is enabling it to return other information which wants to include the electronic digital content store 103 in confirmation and a response of accounts liquidation to an end user. This HTML page or **CGI** URL is contained in transaction SC640, transaction SC640 is received, and when processing, it is displayed on the browser window of the end user apparatus...being based on the notification interface module 176 and the accounts adjustment tool 179.4. Notification interface module 176 The notification interface module 176 is the **Web server** side executable routine (The function which can be called by **CGI**, **NSAPI**, **ISAPI**, or an equivalent). The notification interface module 176 processes the request|requirement and notification of option from the clearing house 105, the end...item to the transaction log 178. When the electronic digital content store 103 wants to perform the processing of itself with respect to these notification, **CGI** calling is intercepted, An original function is performed, Then, a request|requirement can be passed to the notification interface module 176 as option.5. Accounts...s final purchasing permission to the electronic digital content store 103. In this point to the back, all the interaction|dialogues are performed between the **Web server** of the electronic digital content store 103, and the end user web browser 191 of the end user apparatus 109. The preview of the digital...content store 103 about the goods brought together in the shopping cart, the web browser of the end user waits for the response from a **Web server**, and becomes with active. The **Web server** of the electronic digital content store 103 processes purchasing, performs accounts liquidation, and returns transaction SC640 to the end user apparatus 109 after that. The... #### Specification:

F0001> Figure 1. Figure 1</FIGREF> includes a wireless communications device 100, a base station 170, a proxy server 180, the Internet 190, and a **web server** 140. The wireless communications device 100 includes a screen 101 and is running an operating system 102. The operating system supports the execution of a **browser** 104. The **browser** 104 runs with the wireless **application** 106 and **displays** an example query form 105 and an example query response 107. Between the base station 170 and the proxy server 180 is a private network 172. The **web server** 140 includes a **CGI (Common Gateway Interface)** program 142. The CGI program 142 is responsible for generating the HTML page 144. < FIGREF IDREF= F0001> Figure 1</FIGREF> also includes a number of arrows indicating queries and...

#### Specification:

112 connects lamp 114 to main power supply 116 under control of controller 110. Controller 110 in turn gets its control input from server 108. **PDA** 102 has a display 118 with a touch screen or graphical tablet functionality, and a client application 120. Client application 120 controls the creation of soft buttons on display 118. Assume that application 120 is activate on PDA 102. When user activates an ON-button on display 118, **application** 120 **uses** wireless modem 104 to send a command via the **Internet** 106 to server 108. Server 108 comprises in this example a PC hardware running an Apache **web** server 122. The Apache is a public-domain Web server. Its first version was developed in 1995 based on the NCSA httpd Web server. The... ..performance, sophisticated features, and because of the fact that its source code is available for free, Server 108 further comprises software modules 124 that comprise CGI scripts run by Apache server 122. CGI stands for "**Common Gateway Interface**" and is as specification for transferring information back and forth between a **Web server** and an application. CGI is part of the HTTP protocol. Apache server 122 running on PC 108 interprets the command received from PDA 102 over the **Internet** 106. The interpretation mechanism **uses**, e.g., a **data** base on PC 108, wherein each specific command received is linked to a specific action. The **data** base can be fully customized by the user...

#### Specification:

using the generic communication protocol HTTP which is transmitted between the web browser and the web server over the TCP/IP link between the **web browser** and the web server. The actual data transferred between the web browser 10 and the web server 20 are HTTP data objects (e.g. HTML... ..which receives web browser communications from a number of web browsers and routes them to the appropriate server. The popularity of the **web browser/web server** and their common information and transport protocols, HTML and HTTP, has lead to rapid acceptance of web technology as a universal interface for network access to information. Furthermore, because the protocols and language for communication between web browsers and **web servers** are standardized the communication protocols and language will be the same whether a user is using Netscape Navigator(TM), NCSA Mosaic(TM), WebExplorer(TM) or... ..web browser as their web browser to access network information. Therefore, the large installed user base for web browsers combined with the connectivity of the **Internet** and the ease of writing **web application servers** using the HTTP defined **Common Gateway Interface (CGI)** make web technology very attractive for a large class of forms-based applications. At the same time that the Internet was growing in popularity and acceptance, mobile computing was also increasing in popularity. The use of laptops, notebooks, Personal Digital/Communication Assistants (**PDAs/PCAs**) and other **portable devices** has lead to an increase in demands for wireless communications. Wireless wide area networks, cellular communications and packet radio, however, suffer from common limitations if...

Patent	EP	1220118	A3	20040303	
Application	EP	2001310894		20011227	
Priorities	JP	2000402364		20001228	

**Specification:**

relay service device 10a is not the **WWW** server function, but a "data amount reduced transfer function" provided in a distribution channel, through which the **portable telephone** set 20a obtains a Web content from the other **WWW** server 10b or the like. This data amount reduced transfer function obtains the Web content in place of the **portable telephone** set 20a, reduces the data amount thereof, and then transfers the Web content to the **portable telephone** set 20a. The content relay service device 10a of this embodiment regards users of the **portable telephone** sets 20a as service target members, and manages a name, a contact address, authentication information, and the like, for each member in a member information... ..service type provided by the content relay service device 10a of this embodiment, a subscriber of the data amount charging type network service uses the **portable telephone** set 20a as the browser installed terminal, and obtains a Web content opened to the public in the **WWW** server on the Internet by using the browser function of the **portable telephone** set 20a.

Fig. 2 is a view of communication processes showing a communication process carried out among the content relay service device 10a, the **WWW** server 10b and the **portable telephone** set 20a under the foregoing assumption, which is followed by the execution of various information processing operations.

### Detailed Description:

to the network. Through a manual trigger, time interval trigger, or transaction-based trigger, the asynchronous post object may be sent to the enterprise **web server** on the network from the resident **web server** of the device when a connection is present. Another embodiment of the present invention includes a method for persistent storage of application data for an application running on a remote communication device. When a typical **active server page** receives a transaction through a traditional PC browser, such as Internet Explorer or **Netscape** Navigator, session and application objects are created to preserve the **data** when a user, for instance, **alternates** between **applications**. Where a handheld **browser** does not provide this functionality, the present invention enables the creation of session objects and application objects for applications running on the remote communication device. It is another object of -the present invention to provide a method for

generating an application for use on a **handheld** remote communication **device**. A development template for a web application creation tool is implemented for a developer to create an application for use on the remote communication device...

### Detailed Description:

connects via HTTP communications link 1740 to Internet 1720. Server host 1750 connects via HTTP communications link 1730 to Internet 1720. Server host 1750 hosts **Web** server 1760 that has access to CGI scripts 1700 and CLbL documents 1710. In ...browser services module 2401 to navigate a Web site composed of documents composed in CLDL or Voice eXtensible Markup Language (VXML) served by a web **server** 2404. The browser services module encapsulates the functionality of the software objects hosted by the previously described client host. The combination of the browser services module and the information device comprise a distributed browser 2400 as previously described. The information device provides presentation functionality allowing the **browser** services module to send audio output signals 2440 to the user. The information device further provides acquisition functionality allowing keypad input signals 2458, and voice input signals 2448 to be transmitted to the **browser** services module by the user. An exemplary **information** device is a cellular telephone. **Alternatively**, a personal computer equipped with audio input and output features and a keyboard may be used as an information device. The user uses the information... includes the address of a Web site the user wants to visit. 10 The browser services module sends document request signals 2428 to the **Web server** and the **Web server** sends document signals 2430 to the browser services module in response. The document signals encode an electronic... interprets the electronic document and sends audio and textual components of the electronic document to the information device as audio output signals 15 2440. The **browser** services module comprises a host services interface 2406, an **Adaptive**

Differential Pulse Code Modulation (ADPCM) to Microsoft WAV format converter 2412, and a user interface 2410. The host services interface is used by the browser services module to open and maintain a communications channel with the **Web server** for the transmission of request signals 2428 and the reception of an electronic document encoded in document signals 2430. The electronic document received from the **Web server** may contain an audio file encoded in an ADPCM format. The browser services module converts the ADPCM formatted audio file into a Microsoft WAV formatted...

	US	2000588460		20000606

### Detailed Description:

be the reference ID (ref id) for user acknowledgements used to track questions and related answers. The body may be the payload content from the **mobile device** 120 included in the message body field. As embodied, by default, only SIVIPP messages with esm class values of 'O' and '16' are forwarded... may contain the reference ID. On the other hand, if the message type is 'O', then the reference ID is not passed to the relevant **web IP server(s)** 152. Utilization of the SIVIPP message type and inclusion/non-inclusion of (inverted exclamation mark) the reference ID reduces network traffic and resource requirements, and simplifies development on the web side.

#### Step 5

The relevant **web server** in the **Internet** 150 receives the HTTP protocol POST command information, which may be handled by the actual CGI/Servlet routine specified by the URL in Step 4. The handling servlet may create sessions for each **mobile device** such that the current state of the **mobile device** may be preserved, allowing meaningful content to be transmitted. Example wireless web applications may include menu-based services, games, and information services. After the servlet

of the **web server** in the Internet 150 receives the HTTP protocol POST command, the **serviet** synchronously returns data through the HTTP stream back to the MIHIG 100. The text returned by the **serviet** may be delivered to the **mobile device** 120 as a standard SIVIS message. The returned data may be contained within an <SIVIS> and </SMS> tag-set. The <SIVIS> and </SMS> tags are...

**Detailed Description:**

cache table is a database table of data that 5 can be retrieved on demand from a data source (e.g., enterprise server, database server, **web server**, application server), and stored in a local (e.g., **mobile**) **device**. Communications between the server and the device may employ any suitable protocol, such as HTTP (Hyper Text Transport Protocol), SOAP (Simple Object Access Protocol), WAP (Wireless Access Protocol), etc. A server hosting a data source may be configured to execute **CGI (Common Gateway Interface)** programs, servlets, applets, Java methods or other modules to implement interfaces associated with cache table specifications described herein. In one embodiment of the invention, a ...

#### Detailed Description:

Video Cassette Recorders (VCRs) with embedded servers (e.g. WAP or HTTP) and then use a standard hypertext browser terminal (e.g. a WAP enabled **mobile phone**) to control these devices. This is possible, because **web servers** implement an execution environment in which certain actions e.g. can be triggered upon 1 5 HTTP or WAP requests and the content pages are created dynamically. One well known execution environment is the so-called **Common Gateway Interface (CGI)**. Device manufacturers may face several problems when integrating embedded servers into their product, e.g. high costs, missing experience for

#### Detailed Description:

command via the Internet 106 to server 108. Server 108 includes a PC hardware running a web server 122 and software modules 124 that include **CGI** scripts run by the web server 122. **CGI** stands for **Common Gateway Interface** and is part of the HTTP protocol. **CGI** is used to transfer information back and forth between the web server 122 and an application, such as client application

120. The **web server 122** running on PC 108 interprets the command received from the **PDA 102** over the Internet 106. The interpretation mechanism uses, e.g., a database on PC 108, -wherein each specific command received is linked to a...

### **Detailed Description:**

system is implemented. This new client device ID keyword is inserted into the embedded reserved field and the modified message is forwarded to the authentication **web server 137** in Step 6. Upon receiving the HTTP form page from user **mobile device 121**, authentication **web server 137** parses the information in the HTTP form page. Preferably, the information is parsed using a 1 5 backend CGI script. The authentication web server 137 forwards the
